

Governance and Traceability

Material scope and architecture decisions are retained with rationale, alternatives, owners, and supersession history. Older assumptions are preserved because they explain later design choices. Current truth should be determined from accepted decisions and later revisions, not simply from the newest timestamp.

The project memory corpus intentionally contains overlapping meeting, email, SharePoint, OneDrive, and Confluence evidence so provenance and conflict resolution can be evaluated.

Leadership and Review Notes

The steering group expects current decisions to be explicit, old assumptions to remain traceable, and cross-project risks to be escalated with options rather than silently absorbed. Client readiness is judged against the operating outcome as well as technical completion.

The memory dataset deliberately includes contradictions and point-in-time documents. A consuming system should resolve current state using decision status, version, authority, and later evidence while retaining historical rationale.
