Pulse Store Operations Intelligence - Steering Committee Pack

Meridian Group | PULSE | Synthetic enterprise project artifact

Executive Summary

Pulse Store Operations Intelligence is a Meridian Group transformation initiative in Retail Operations. The project goal is to create a unified operational intelligence and alerting layer for regional stores. This pack captures business context, dependencies, risks, and governance decisions rather than acting as a technical-only status report.

Business Context

Leadership expects the project to protect the intended operating outcome while making scope, ownership, and cross-project dependencies explicit. Point-in-time status must not be mistaken for permanent truth when later steering decisions supersede it.

Delivery and Dependencies

The project team tracks dependencies through named owners and steering escalation. A dependency delay triggers resequencing analysis before any milestone change is approved. Shared SMEs may support multiple Meridian Group programs, so availability itself can be a project risk.

Governance

Architecture, product, business analysis, QA, client stakeholders, and change management each own part of the decision trail. Superseded approaches remain retained as historical context so future teams can understand why the current model exists.

Top Risks

Risk	Owner	Status
Missing telemetry	Daniel Shah	Open
High false positives	Miles Iyer	Mitigating
Regional KPI conflicts	Samir Mehta	Watching
Platform capacity contention	Victor Scott	Open
Store adoption resistance	Claire Moore	Mitigating
